Detailed System Workflow

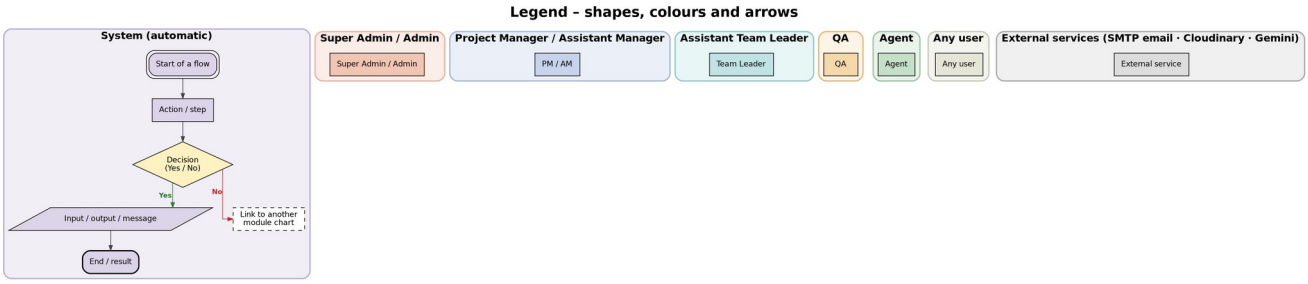

Master overview and module flowcharts

System: TFS HRMS (shown to users as "TFS Ops Tracker")

Version 1.0 · 23 October 2026 · Prepared from the source code (backend-api, qc-backend, hrms-frontend-live)

How to read these charts

Each chart shows one part of the system as a flowchart. Coloured bands ('swimlanes') show who does each step. Yellow diamonds are decisions: the green arrow is Yes, the red arrow is No. Rounded boxes with a double border are where a flow starts; bold rounded boxes are where it ends. The legend below explains every shape and colour.

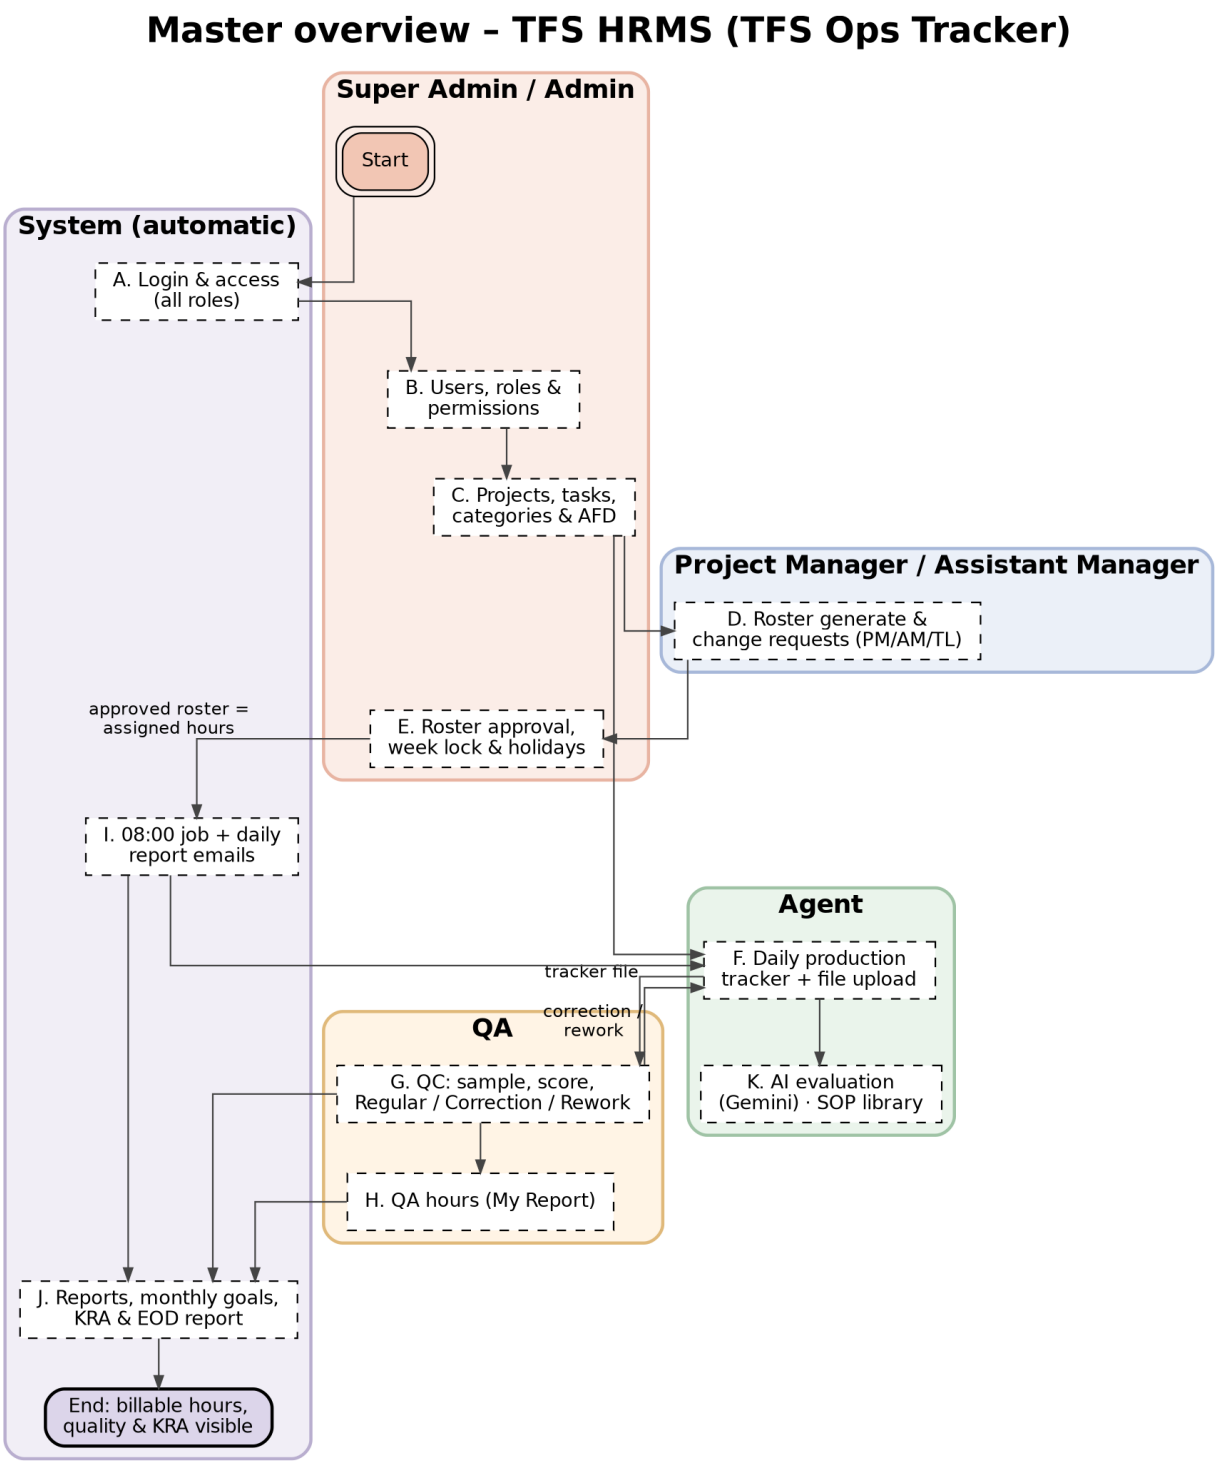

Legend

Chart	Module
00	Master overview
A	A. Login, password reset & access
B	B. User management & permissions
C	C. Projects, tasks, categories & AFD
D	D. Roster: generate & change requests
E	E. Roster approval, week lock & holidays
F	F. Agent daily production tracker
G	G. QC process
H	H. QA hours (My Report)
I	I. Scheduled jobs & report emails
J	J. Reports, monthly goals & KRA
K	K. AI evaluation & SOP library

Master overview

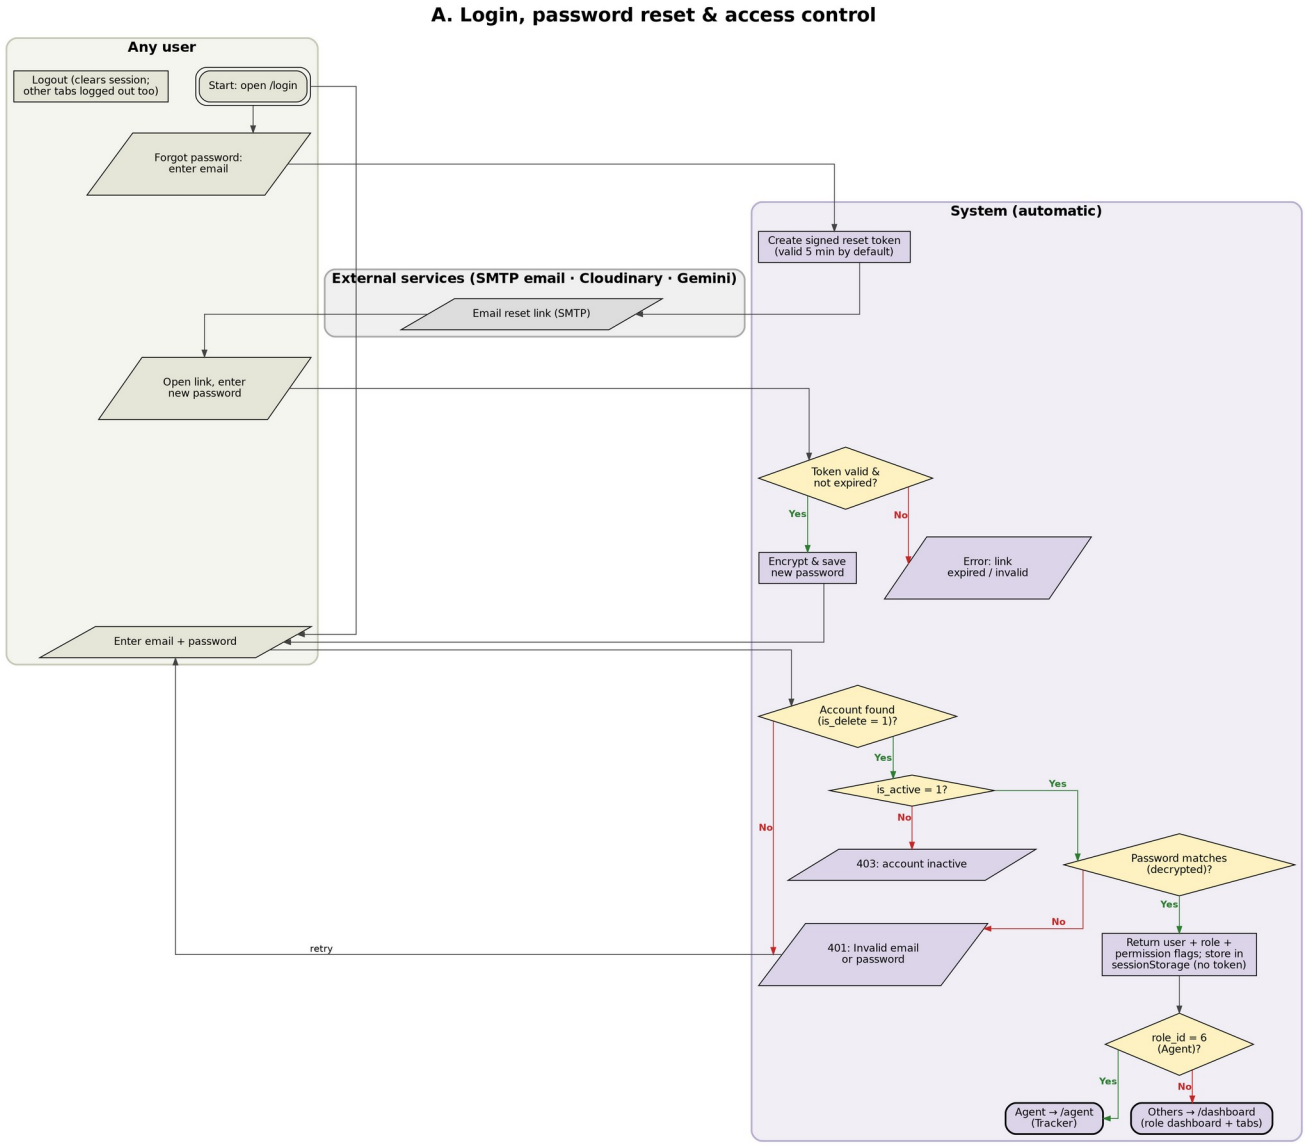

How the whole system fits together. Admins set up users and projects (B, C). Managers build each person's monthly roster and Admins approve it (D, E); the approved roster gives every agent their assigned hours each morning (I). Agents log their daily production and upload files (F). QA check those files and either pass them or send them back for correction or rework (G), and QA time is counted automatically (H). Everything flows into the reports and KRA scores (J). Dashed boxes point to the detailed chart for that module.

Master overview

A. Login, password reset & access

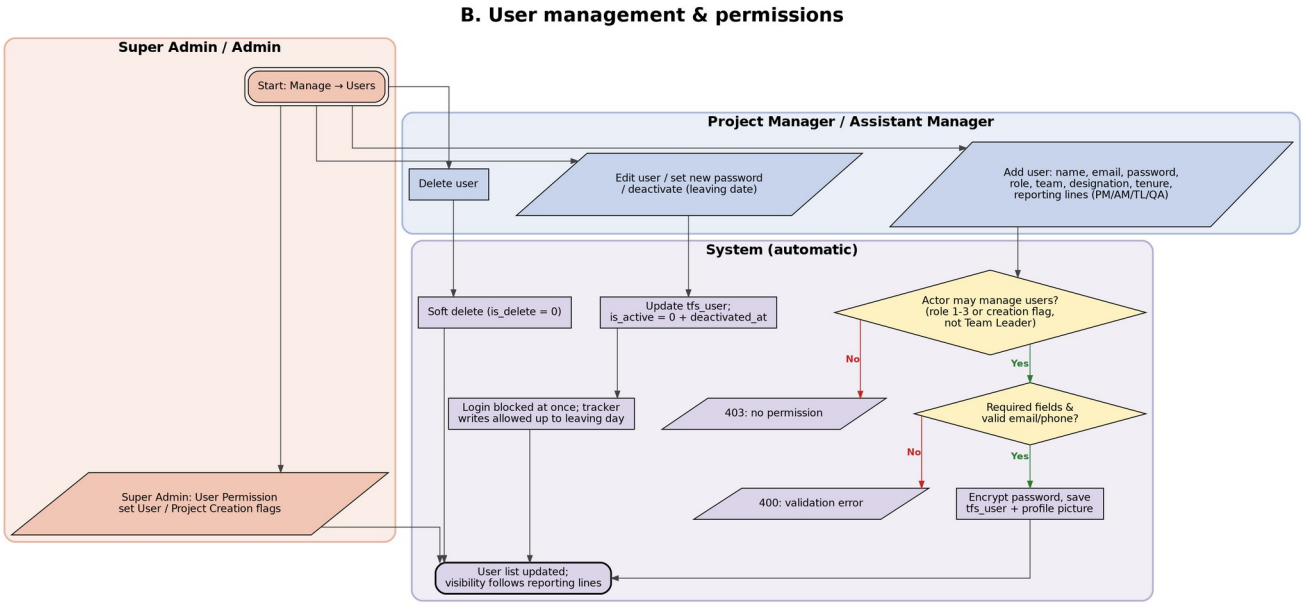

A user signs in with email and password. The system checks that the account exists, is active and the password matches. Agents go straight to their Tracker; all other roles go to their Dashboard, which shows only the tabs their role allows. If a password is forgotten, a reset link is emailed and works for 5 minutes by default. Logging out in one tab logs out the other tabs too.

A. Login, password reset & access

B. User management & permissions

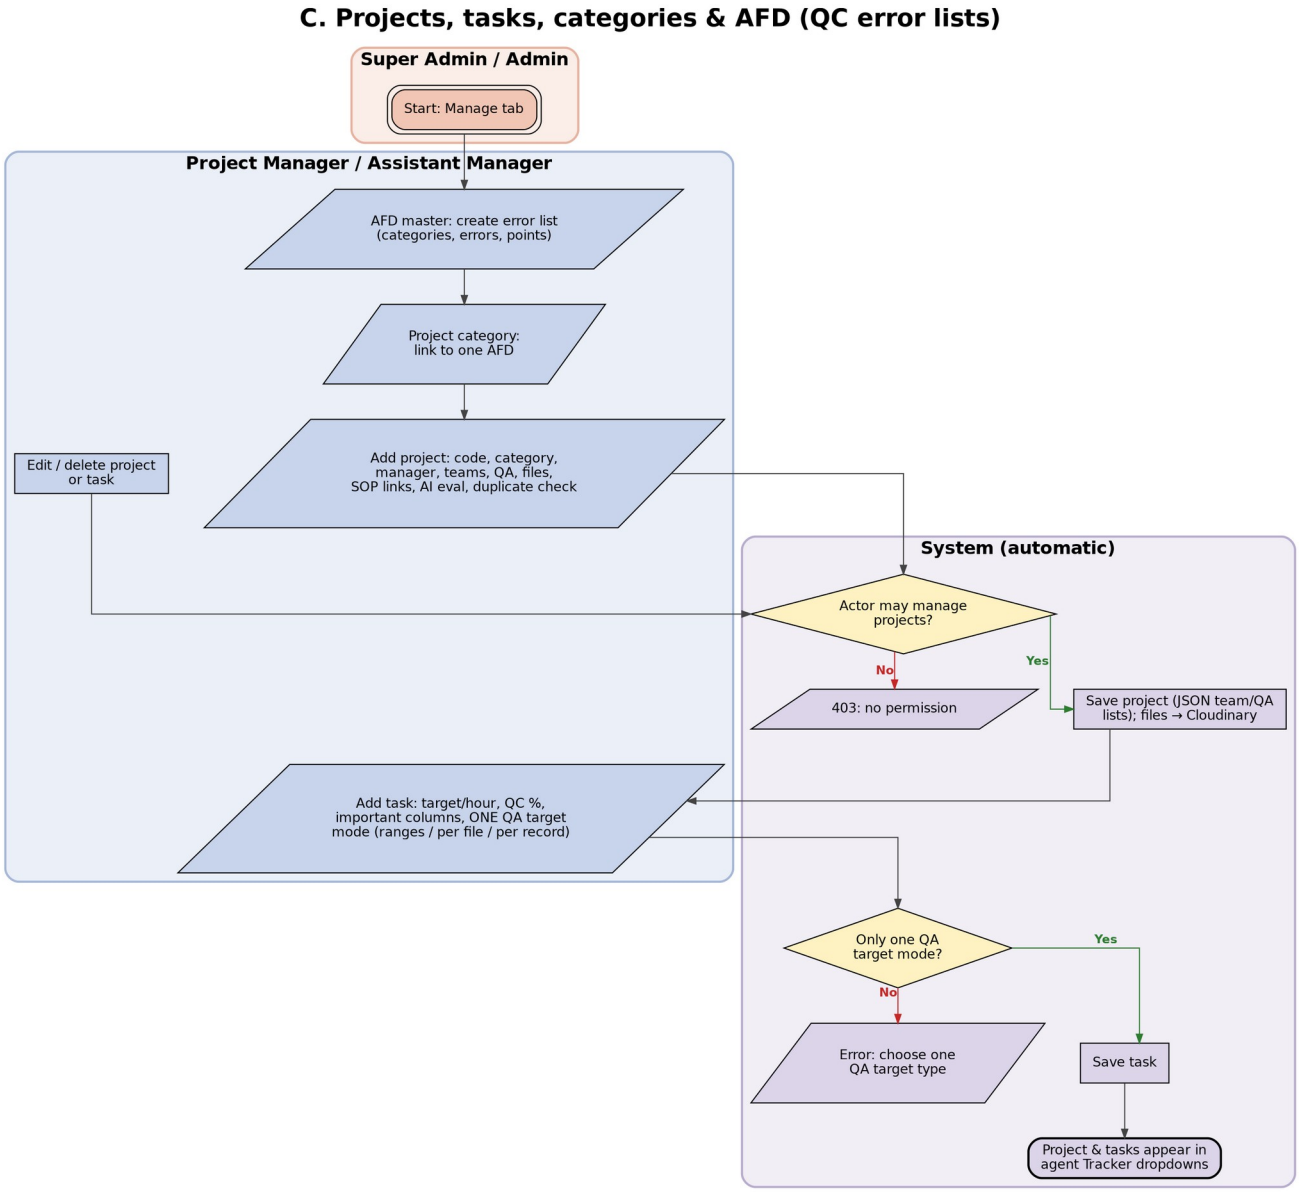

Super Admin, Admin, Project Manager (or anyone given the User Creation flag, except Team Leaders) can add users. Each user gets a role, a team and reporting lines (Project Manager, Assistant Manager, Team Leader, QA) – these lines decide what each person can see in reports. Deactivating a user stops login immediately, but tracker entries are still allowed up to their leaving date. Deleting is a 'soft' delete: the record is hidden, not erased.

B. User management & permissions

C. Projects, tasks, categories & AFD

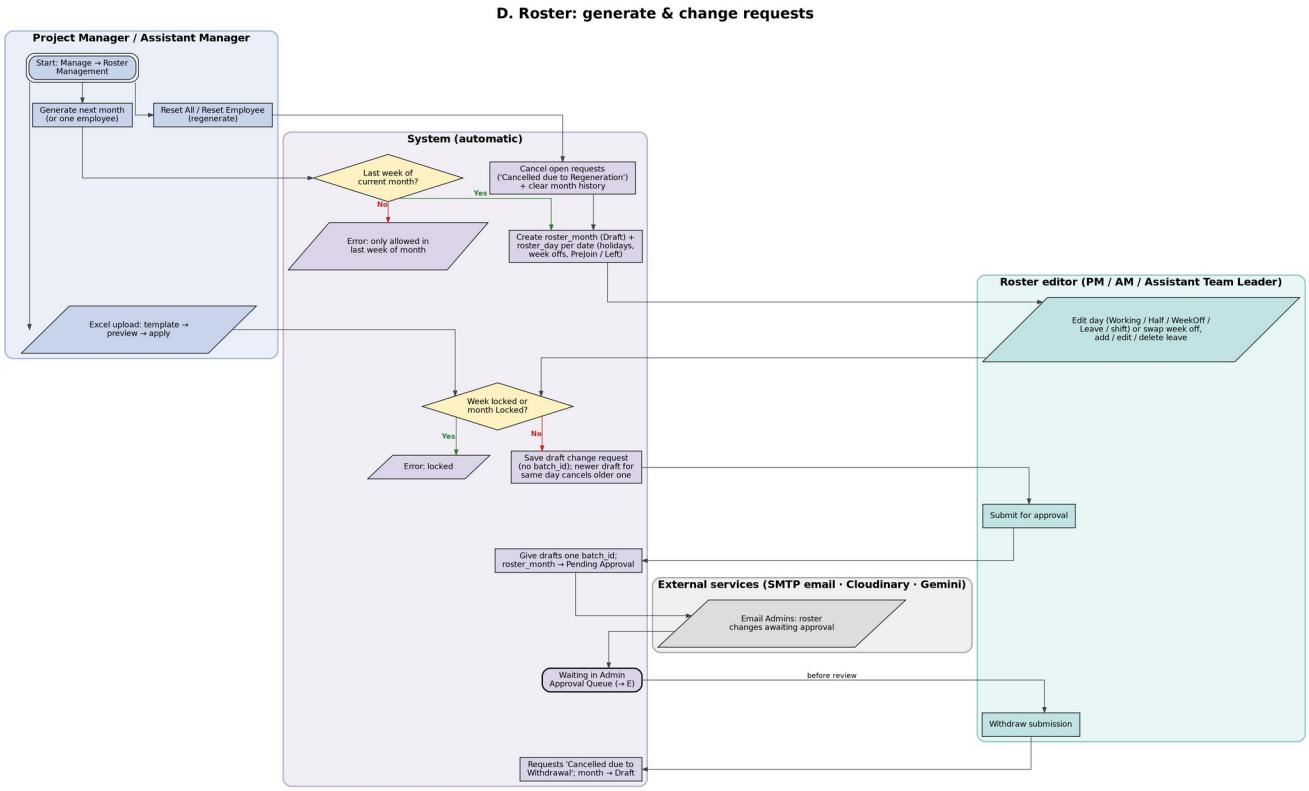

Setup happens in this order: create the AFD (the list of QC errors and their penalty points), create a project category linked to that AFD, then create the project and its tasks. Each task has a target per hour, a QC sampling percentage, the 'important columns' used for duplicate checks, and exactly one way of counting QA time.

C. Projects, tasks, categories & AFD

D. Roster: generate & change requests

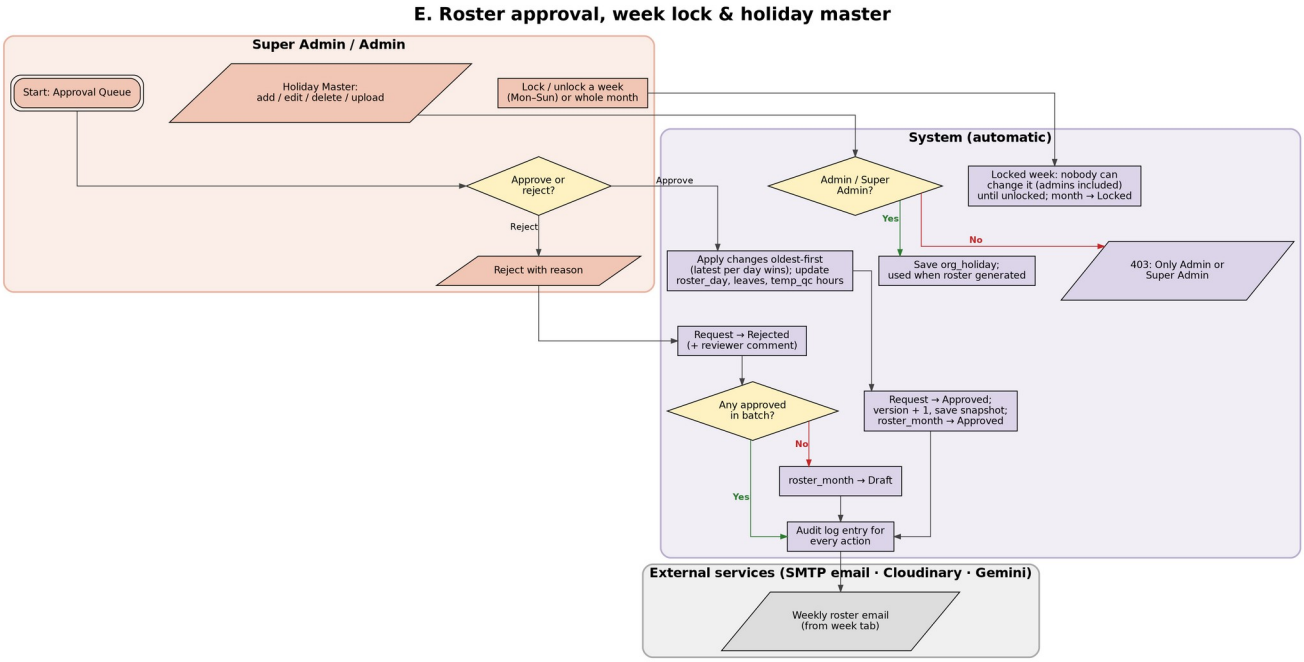

In the last week of a month, managers generate next month's roster for everyone (or one person). Managers and Assistant Team Leaders then change days or leave; each change is saved as a draft (only the newest draft per day is kept). Clicking Submit sends all drafts together to the Admins for approval and emails them. Locked weeks cannot be changed. Reset regenerates the month and cancels open requests.

D. Roster: generate & change requests

E. Roster approval, week lock & holidays

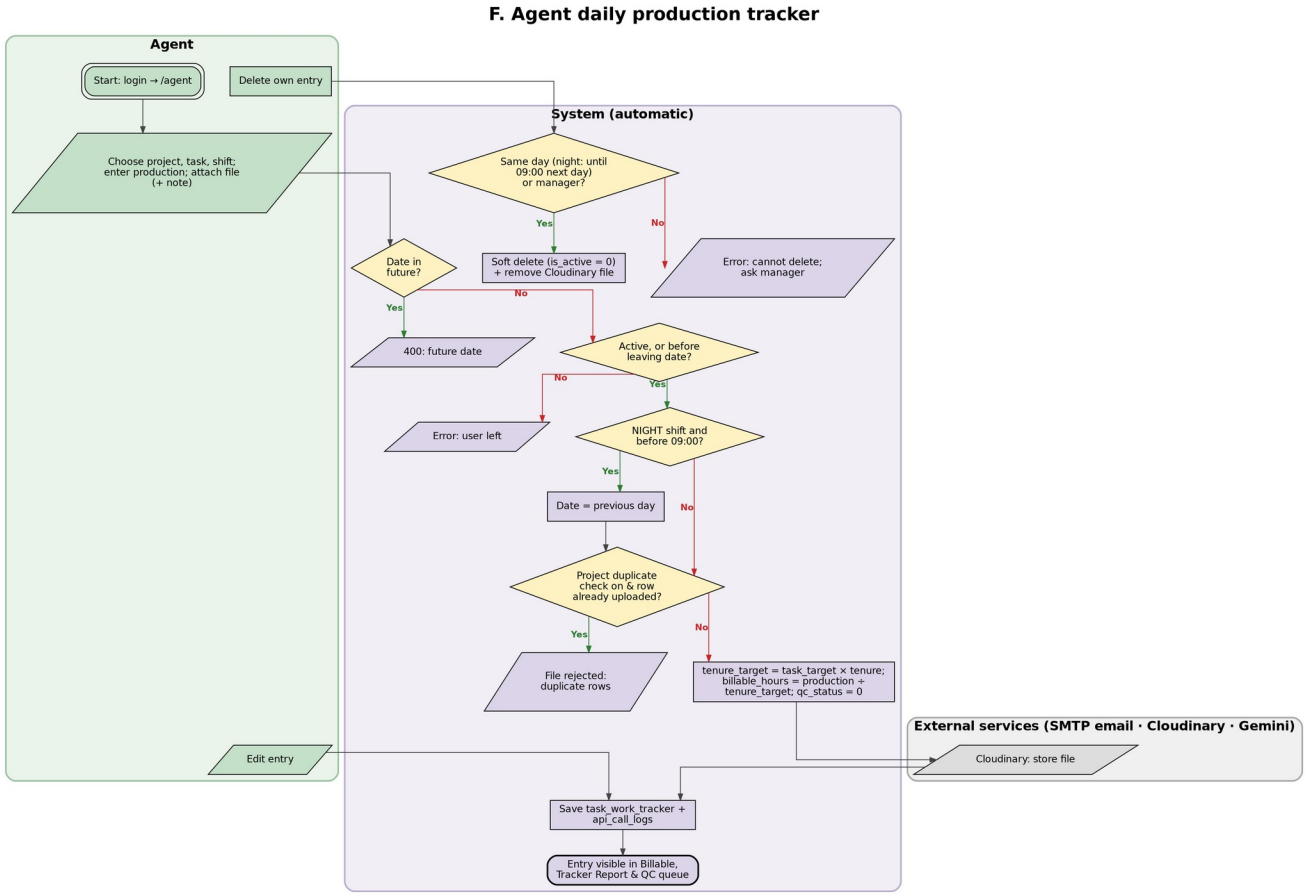

Only Admin and Super Admin approve or reject roster changes. Approving applies the changes (oldest first so the latest change wins), raises the roster version and saves a snapshot. Rejecting needs a reason; if nothing in the batch was approved the roster goes back to Draft. Admins can lock whole weeks so nobody can change them, and maintain the Holiday Master used when rosters are generated. Every action is written to the audit log.

E. Roster approval, week lock & holidays

F. Agent daily production tracker

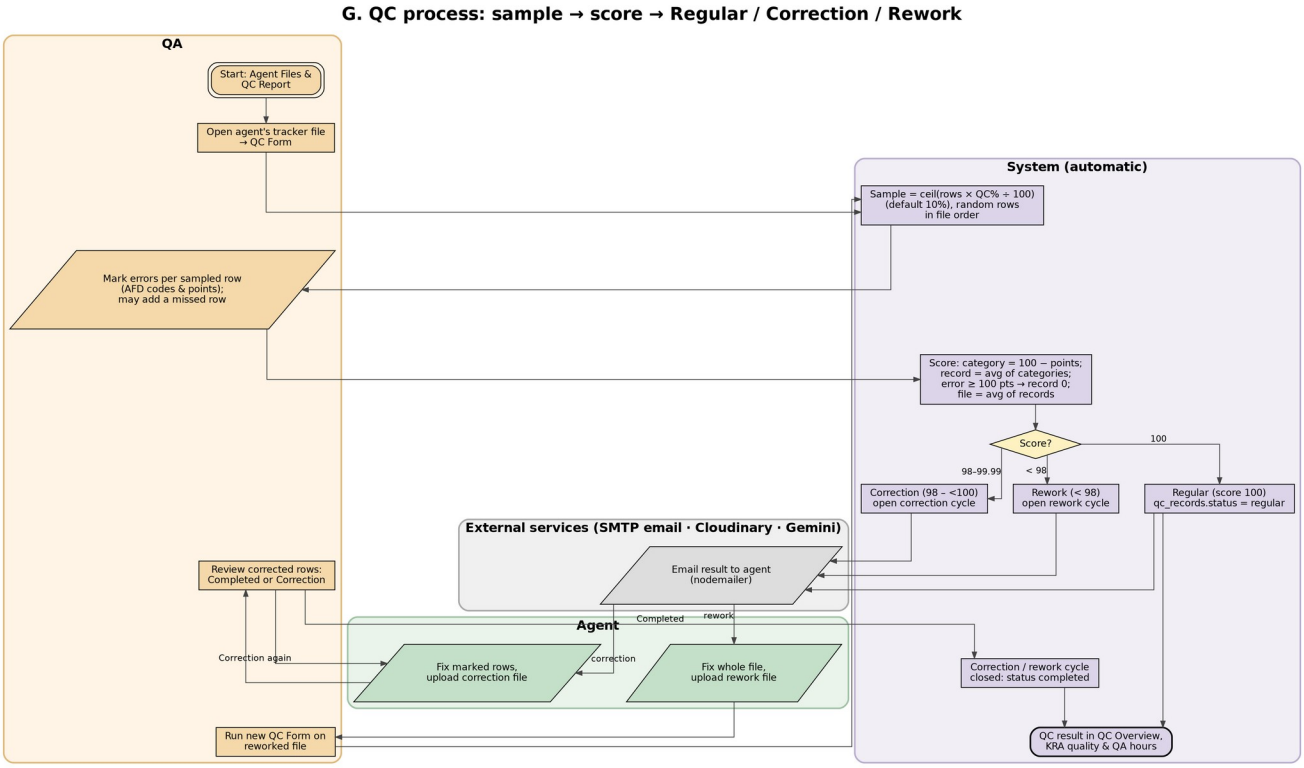

Agents add one entry per piece of work: project, task, shift, production count and the output file. Future dates are refused. A night-shift entry made before 09:00 is counted for the previous day. If the project has duplicate check on, a file containing rows already uploaded is refused. Billable hours are worked out automatically from the task target and the agent's tenure. Agents can delete only same-day entries; managers can delete any.

F. Agent daily production tracker

G. QC process

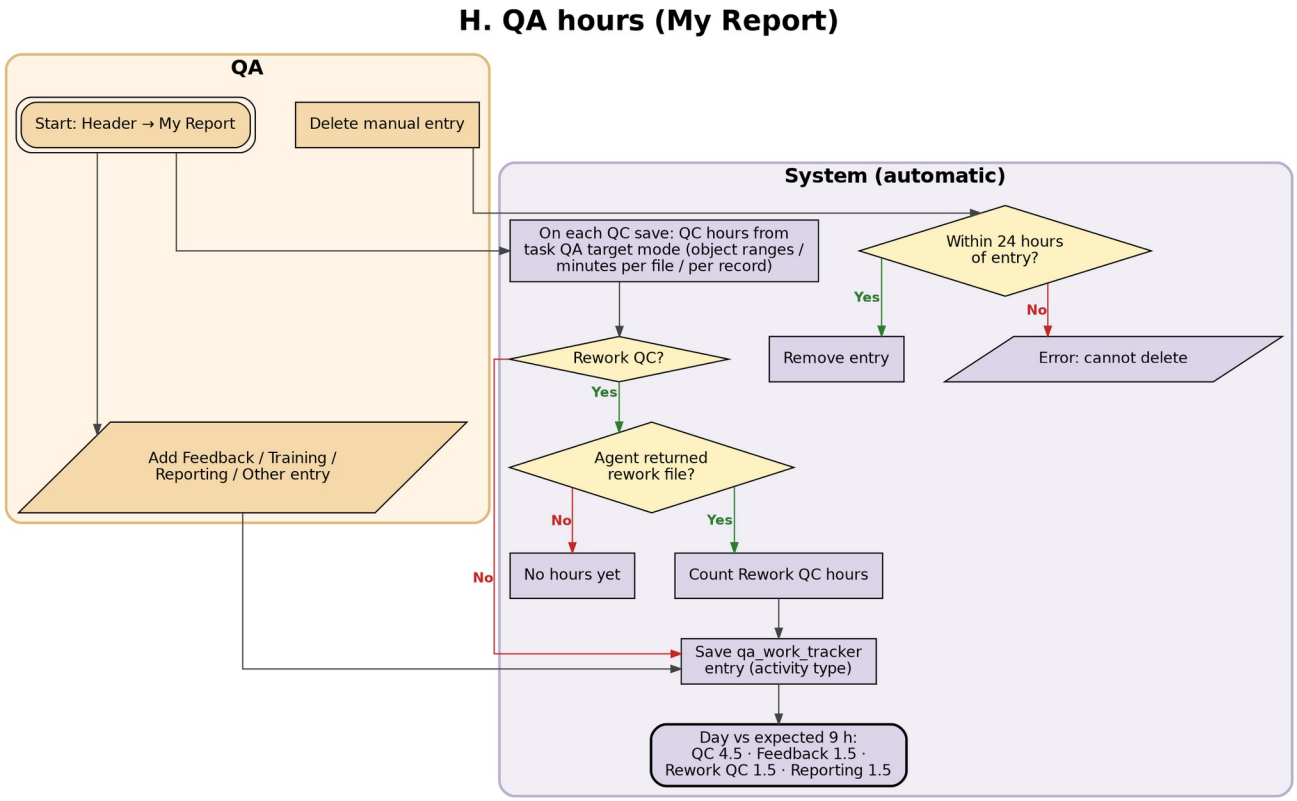

QA open an agent's file in the QC Form. The system picks a random sample (by default 10% of rows). QA mark errors; the score is calculated automatically and decides the result: 100 = Regular (pass), 98 to just under 100 = Correction (agent fixes the marked rows), below 98 = Rework (agent fixes the whole file and QA run a new QC). The agent is emailed each result. Cycles can repeat until the file passes.

G. QC process

H. QA hours (My Report)

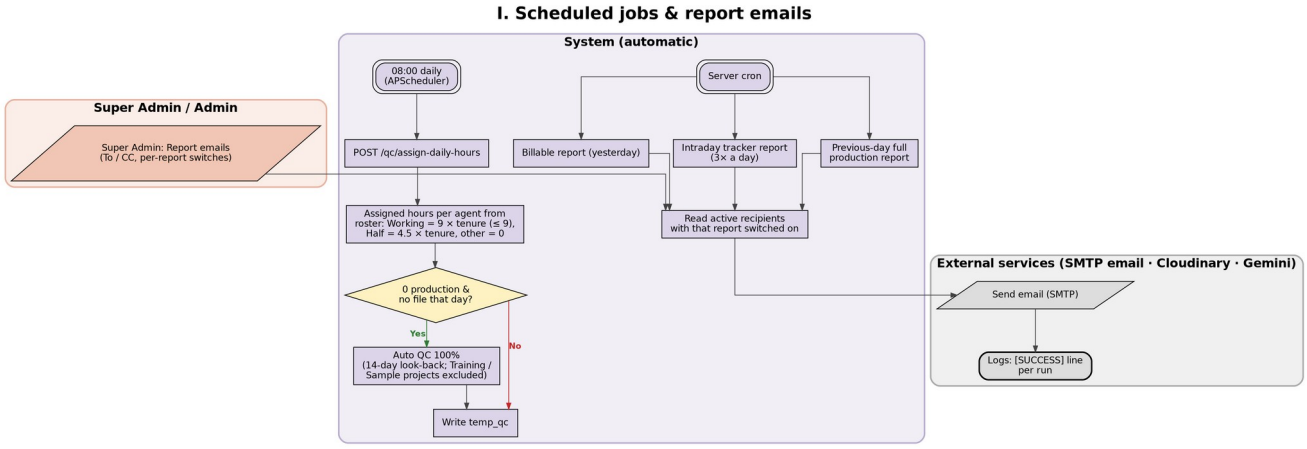

QA time is counted automatically from each QC using the task's QA target. Rework QC time is counted only once the agent has returned the reworked file. QA can add their own Feedback, Training, Reporting and Other entries and delete them within 24 hours. The expected day is 9 hours split across QC, feedback, rework QC and reporting.

H. QA hours (My Report)

I. Scheduled jobs & report emails

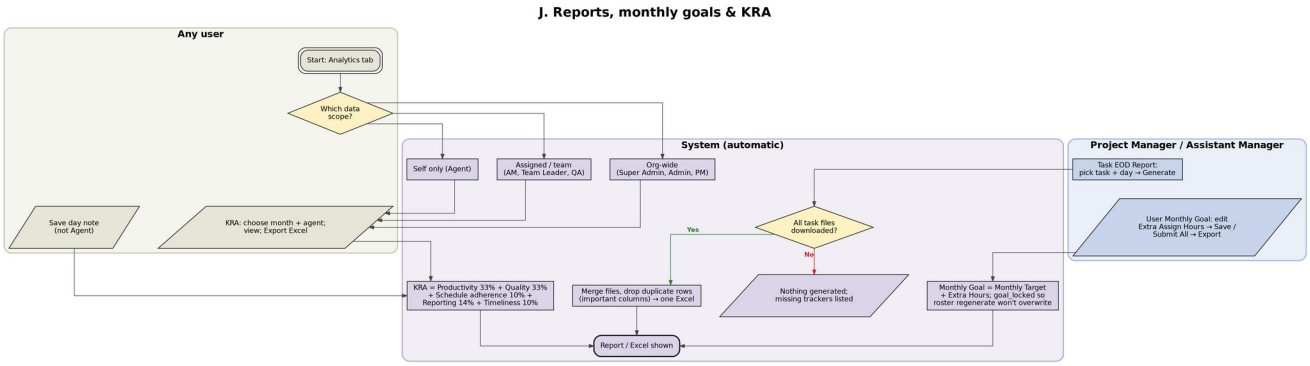

Every morning at 08:00 the system works out each agent's assigned hours from the roster and their tenure, and automatically gives 100% QC for days with zero production and no file. Separately, the server sends the billable report, the intraday tracker report (three times a day) and the previous-day production report to the people the Super Admin has listed under Report emails.

I. Scheduled jobs & report emails

J. Reports, monthly goals & KRA

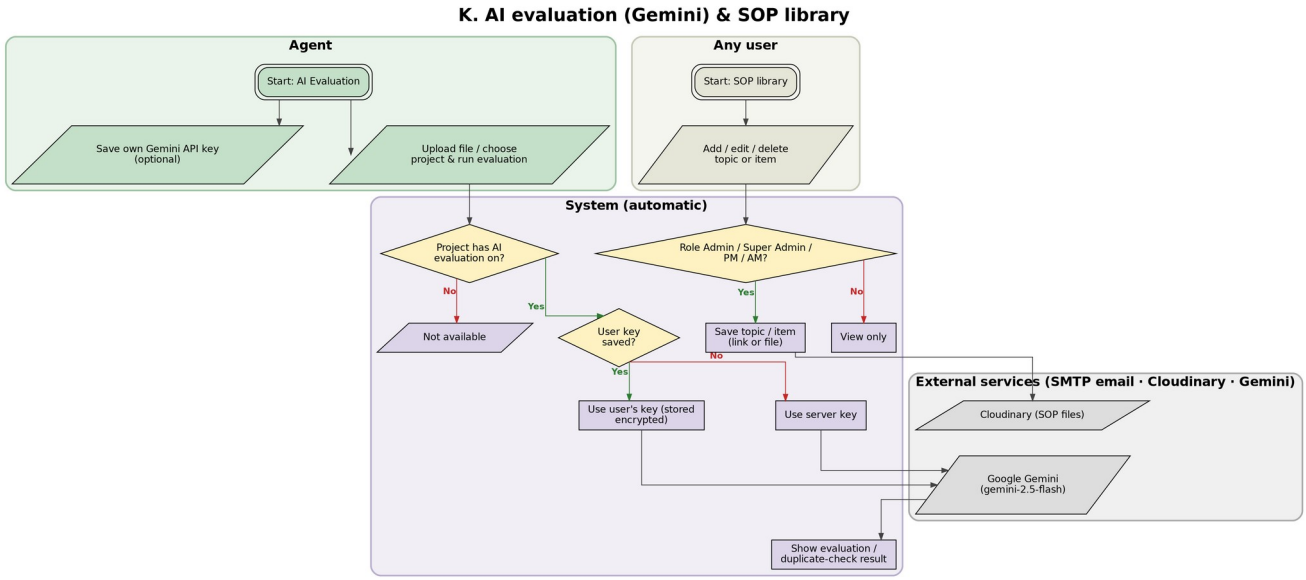

Every report is filtered by role: Super Admin, Admin and Project Manager see everyone; Assistant Managers, Team Leaders and QA see their assigned people; Agents see only themselves. Managers can add Extra Assign Hours to monthly goals. KRA combines productivity, quality, roster adherence, reporting and timeliness into one score and can be exported to Excel. The Task EOD Report merges all files for one task and day into a single Excel without duplicates.

J. Reports, monthly goals & KRA

K. AI evaluation & SOP library

Agents can run an AI (Google Gemini) evaluation of their file for projects where it is switched on, using their own saved key or the server key. The SOP library holds topics with links or files; Admin, Super Admin, Project Manager and Assistant Manager can edit it and everyone can view it.

K. AI evaluation & SOP library
